```

Build your Image Manually (Demo)

1. Ensure the official image microsoft/iis exists in the local registry
Docker images -a
2. Start a Windows Container using the image microsoft/iis
docker run -d --name myIIS -p 80:80 microsoft/iis
3. Start an interactive cmd in the container
Docker ps
Docker exec -i myIIS cmd
4. Changing the default page in IIS
del C:\inetpub\wwwroot\iisstart.htm
echo "Hello World From a WinServer Container" > C:\inetpub\wwwroot\index.html
Exit
5. Check the container is stopped
docker ps -a
6. Build the image using Docker commit
docker commit myIIS modified-iis

Dockerfile's (Docker Build)

- Method for automated container image build
- Consumed when running "docker build"
- Enables automated builds via docker hub
- Caches unchanged commands
- IIS Image
 - FROM windowsservercore
 - RUN powershell -command Add-WindowsFeature Web-Server
- WebApp Image
 - FROM iis
 - ADD mysite.htm inetpub\mysite.htm

Dockerfile Common commands

Full explanation [here](#)

FROM	It defines the base image to use to start the build process
LABEL	This non-executing command declares the author, hence setting the author field of the images
ADD	The ADD instruction copies new files, directories or remote file URLs from <src> and adds them to the filesystem of the image at the path <dest>.
COPY	Similar to ADD, but it lacks support for URLs and auto unpack of recognized compression format
RUN	It takes a command as its argument and runs it to form the image. Unlike CMD, it actually is used to build the image (forming another layer on top of the previous one which is committed).
CMD	An initial, default command that gets executed (i.e. run) with the initiation of containers based on the image. It can be overridden by runtime parameter in "docker run"
EXPOSE	The EXPOSE command is used to associate a specified port to enable networking between the running process inside the container and the outside world (i.e. the host). EXPOSE port(s) will be mapped to Container Host random port(s) when -P option is used in Docker Run
ENTRYPOINT	ENTRYPOINT argument sets the concrete default application that is used every time a container is created using the image. It <u>cannot</u> be overridden by runtime parameter in "docker run"

Viewing Image History

Docker history --no-trunc <image name>

```
C:\demo\iis>docker history --no-trunc joedocker758/nanoserver-iis
IMAGE                                SIZE          COMMENT                                CREATED      CREATED BY

```

Images and Layers

When you create a new container, you add a new, thin, writable layer on top of the underlying stack. This layer is often called the "container layer"

Containers, images and layers

- Running containers sharing same image but each with its own thin writable container layer,

Docker Tag

- You may change the image and tag using:
 - `docker tag IMAGE[:tag] IMAGE[:tag]`

```
C:\demo\nanoserver-iis-custom>docker images
REPOSITORY                                TAG                IMAGE ID            CREATED             SIZE
joedocker758/nanoserver-iis-custom        latest             bf5e2bf204e2       16 minutes ago     937 MB

```

Running and Managing Containers

Starting Containers

- General Syntax:
 - `docker run [OPTIONS] IMAGE[:TAG] [COMMAND] [ARG...]`
- Start container interactively with pseudo-TTY
 - `docker run -it <image>`
- Start container in background
 - `docker run -d <image>`
- Start container interactively with pseudo-TTY and run cmd.exe when container is created
 - `docker run -it <image> cmd`
- Start Hyper-V container (only Windows containers)
 - `docker run -d --isolation=hyperv <image>`

Process to start when starting a container

- Each container is designed to start a process when it is initialized. Container will stop automatically when the starting process ends
- The default starting program is specified in the ENTRYPOINT or CMD command in the Dockerfile when the image is built by developer
- The default starting program can be overridden at runtime using the `--entrypoint` or command parameters
 - `docker run [OPTIONS] IMAGE[:TAG] [COMMAND] [ARG...]`
 - `docker run --entrypoint [Entry point command] IMAGE[:TAG] [ARG...]`
- Example:
 - `Docker run --entrypoint ping joedocker758/nanoserver-iis:latest localhost -t`

Identifying container

- Show the list of running containers

`docker ps`

- Show the list of all containers (including stopped ones)

`docker ps -a`

- Container can be identified by container name, container ID (UUID short identifier), or UUID long identifier

```
C:\Windows\system32>docker ps
CONTAINER ID   IMAGE                                COMMAND                  CREATED        STATUS        PORTS        NAMES

34944a7d774b   joedocker758/nanoserver-iis-custom "C:\\ServiceMonitor..." 50 minutes ago Up 50 minutes    0.0.0.0:83->80/tcp high_poitras
a8a5714c47e9   joedocker758/nanoserver-iis       "C:\\ServiceMonitor..." 58 minutes ago Up 58 minutes    0.0.0.0:80->80/tcp stoic_hopper

C:\Windows\system32>docker ps -a
CONTAINER ID   IMAGE                                COMMAND                  CREATED        STATUS              PORTS        NAMES
d03325a3dd67   joedocker758/nanoserver-iis       "ping localhost -t"     2 minutes ago   Exited (3221225786) 12 seconds ago          hopeful_lovelace
e255b5c3a92f   joedocker758/nanoserver-iis       "c://servicemonito..." 3 minutes ago   Exited (0) 3 minutes ago          jovial_hodgkin
a1606b227761   microsoft/nanoserver             "ping localhost -t"     17 minutes ago   Up 17 minutes          romantic_panini
8519c1db8ff6   microsoft/nanoserver             "cmd"                  23 minutes ago   Exited (9009) 18 minutes ago          eager_ramanujan
022f4718f0ff   iis                              "cmd"                  25 minutes ago   Exited (0) 23 minutes ago          
```

Stopping and removing container

- Stop a container
 - `docker stop [container id|container name]`
- Remove a container
 - `docker rm [container id|container name]`

Docker Run (more options...)

- Start Container with a custom hostname and container name
`docker ps -d --hostname WS2K16VM22 --name WS2KVM22 microsoft/nanoserver cmd`
- Start Container attached to default nat network, with port mapping from container port 80 to host port 81
`docker ps -it -p 81:80 microsoft/iis cmd`
- **Execute a command in a running container**
`docker exec -it [container id] cmd`
- **Attach to a running container**
`Docker run --name demo1 -d microsoft/nanoserver ping localhost -t`
`Docker attach demo1`
- **Show process within a container**
`Docker top <container name>`

Limit a container's resources

- By default, a container has no resource constraints
- can use as much of a given resource as the host's kernel scheduler allows.
- Docker provides ways to control how much memory, or CPU a container can use

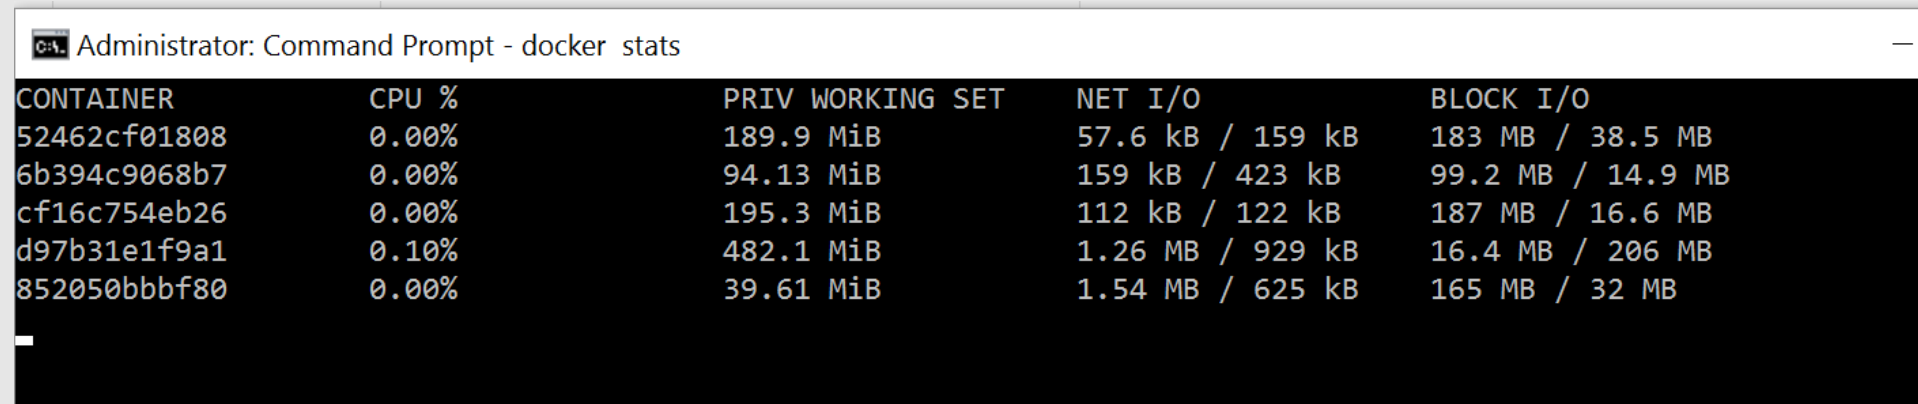

Resource	Option	Example
Memory	--memory	--memory=200m
	--memory-reservation	--memory-reservation=50m
CPU	--cpu-shares	--cpu-shares=2048 (default is 1024)
	--cpu-percent	--cpu-percent=10

Example:

```
docker run -d -p 8383:80 -m 200m --cpu-shares 2048 microsoft/nanoserver ping localhost -t
```

Monitoring Container Resource Usage

Use docker stats

CONTAINER	CPU %	PRIV	WORKING SET	NET I/O	BLOCK I/O
52462cf01808	0.00%	189.9 MiB		57.6 kB / 159 kB	183 MB / 38.5 MB
6b394c9068b7	0.00%	94.13 MiB		159 kB / 423 kB	99.2 MB / 14.9 MB
cf16c754eb26	0.00%	195.3 MiB		112 kB / 122 kB	187 MB / 16.6 MB
d97b31e1f9a1	0.10%	482.1 MiB		1.26 MB / 929 kB	16.4 MB / 206 MB
852050bbbf80	0.00%	39.61 MiB		1.54 MB / 625 kB	165 MB / 32 MB

Knowledge Check

1. What command gets an image from repository?
2. What does docker build command do?
3. Steps to publish image to repository
4. How to limit container resources?
